Introduction to CROCO and Parallelisation

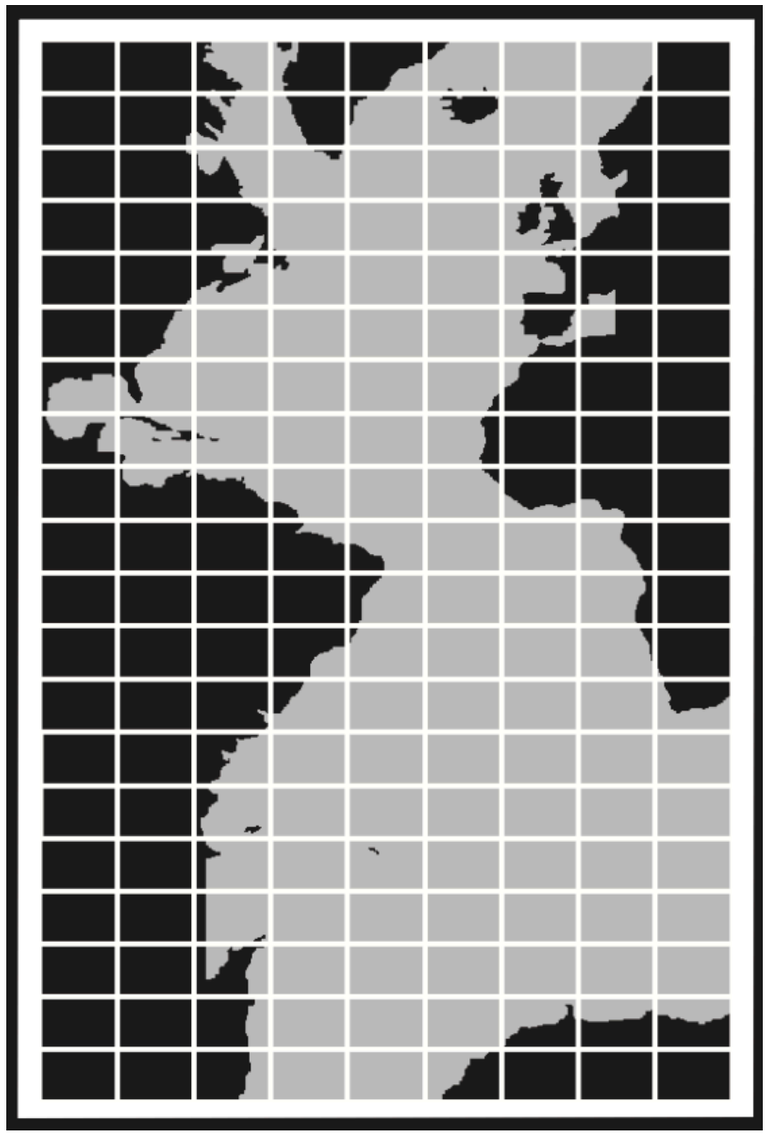
Rachid Benshila

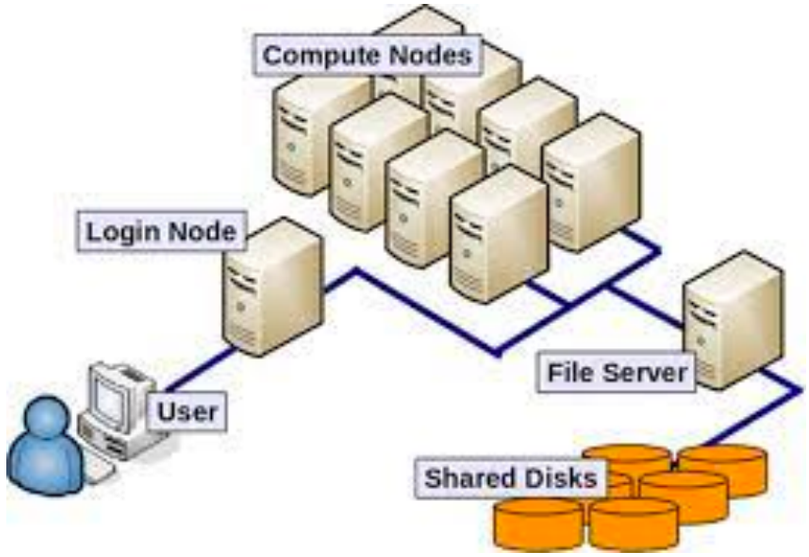
Concept et techniques

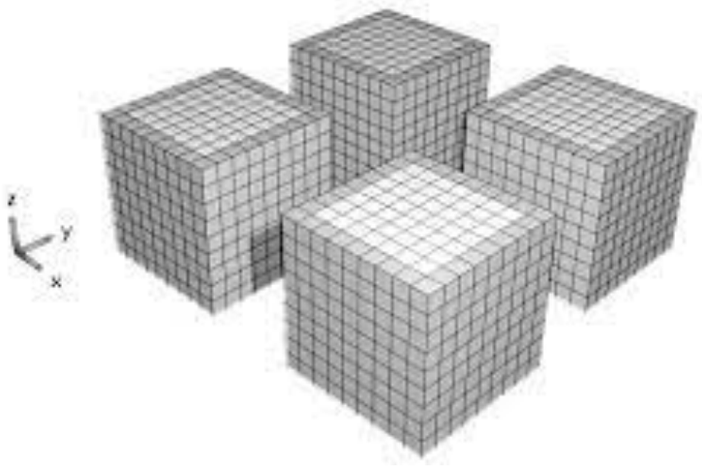
Utilisation dans CROCO

Aspects connexes

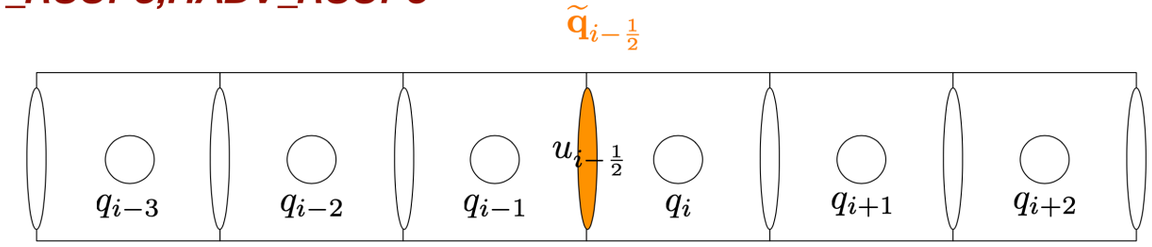
Parallelisation : décomposition de domaine



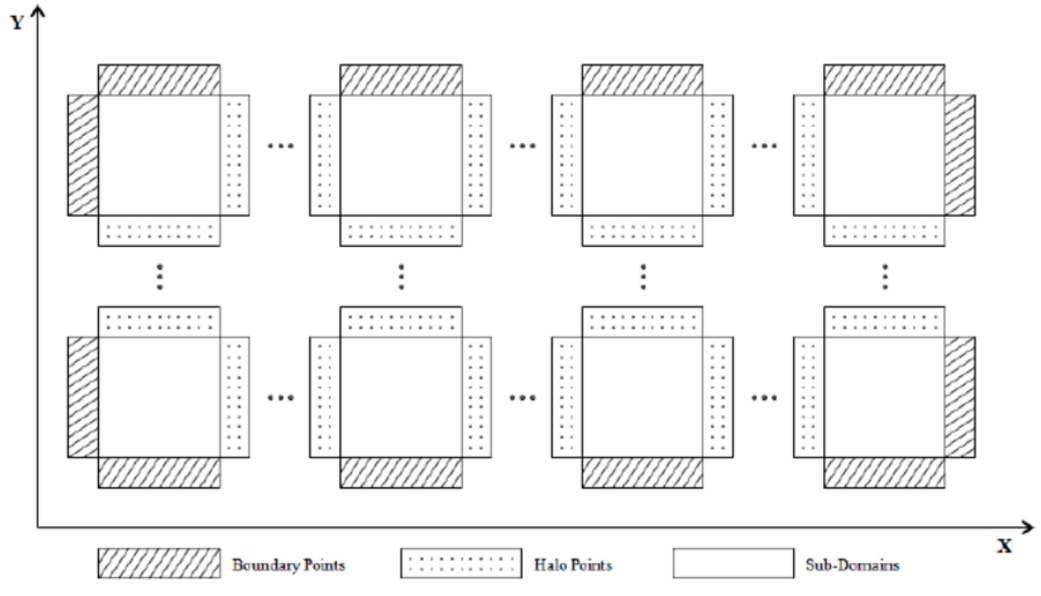




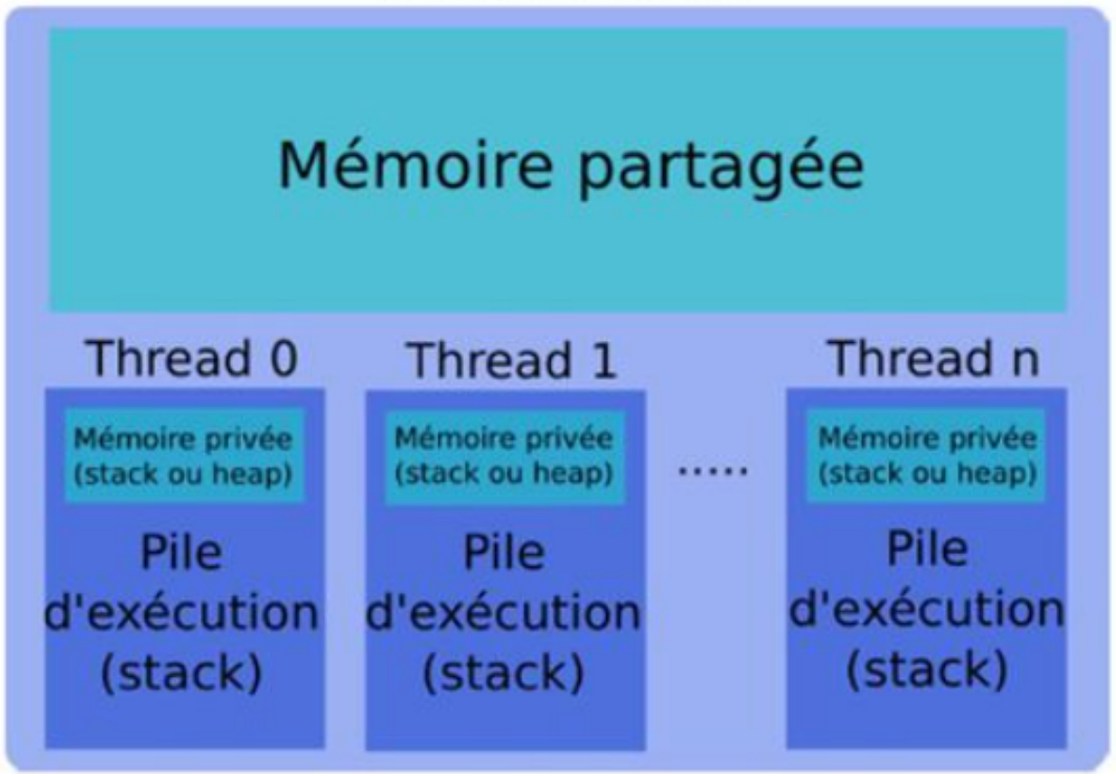
HADV_RSUP3,HADV_RSUP5

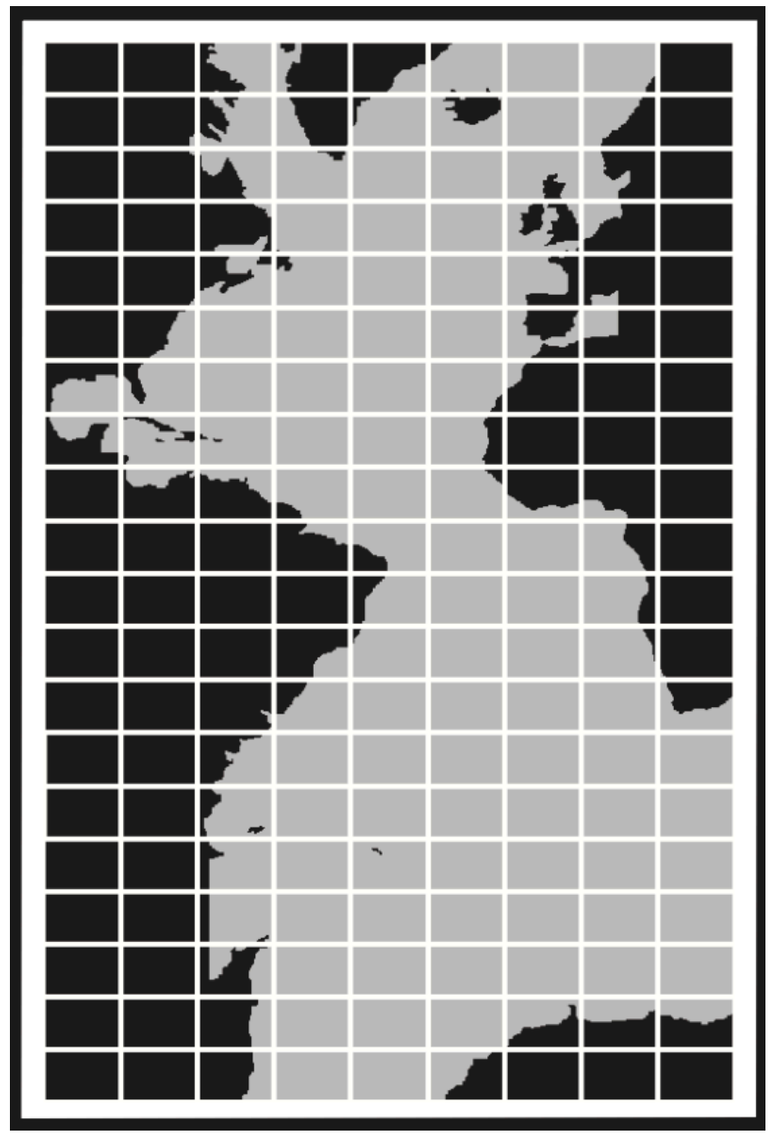


$$\partial_x(uq)|_{x=x_i} = \frac{1}{\Delta x_i}\left\{u_{i+\frac{1}{2}}\widetilde{q}_{i+\frac{1}{2}} - u_{i-\frac{1}{2}}\widetilde{q}_{i-\frac{1}{2}}\right\}$$



Approche 1 : mémoire partagée

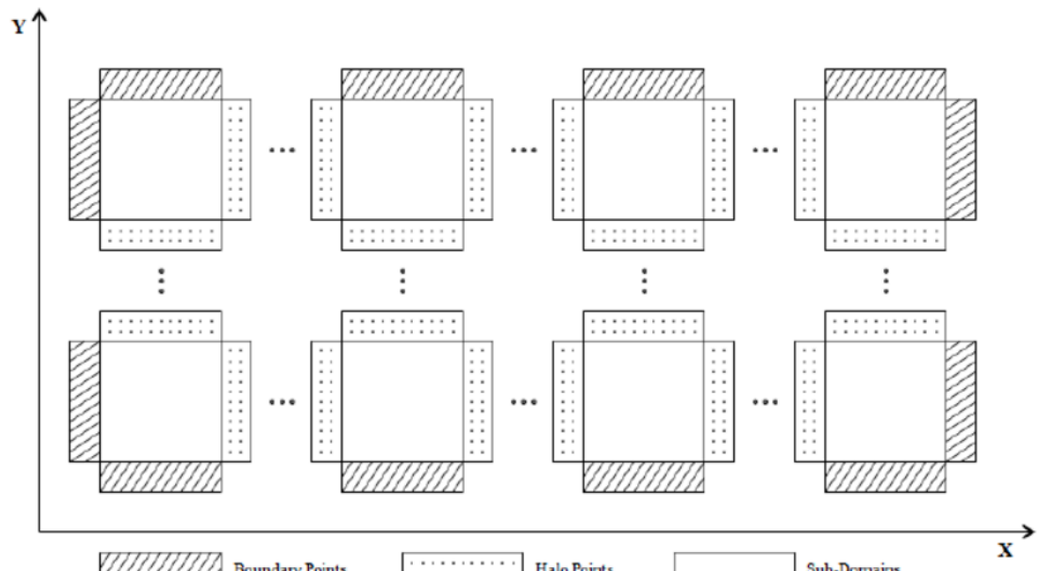




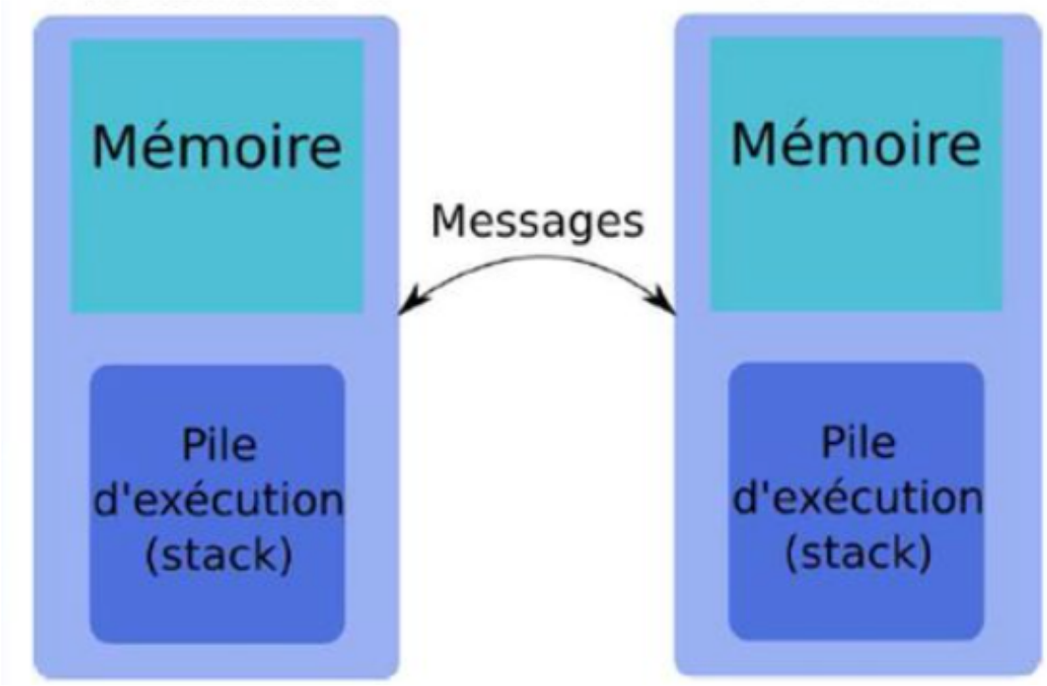
=> les coeurs de calcul ont accès
à une mémoire commune

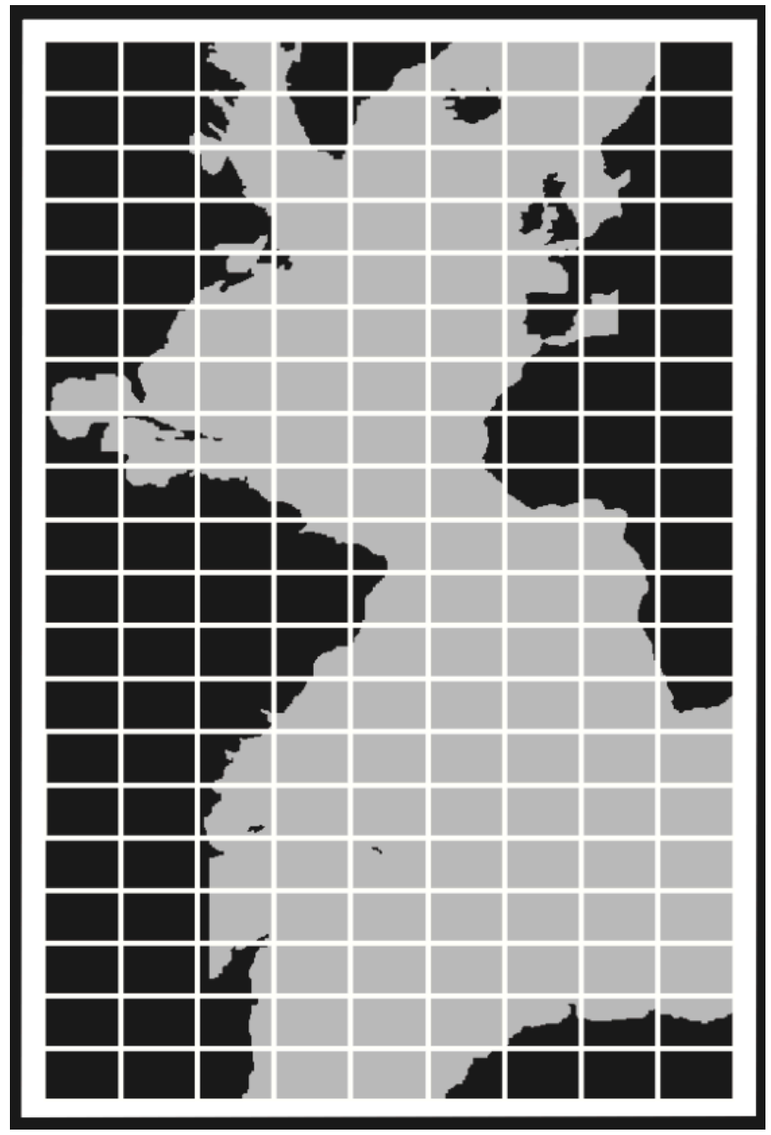
=> échanges par copie mémoire

Standard OpenMP
(Open Multi-Processing)



Approche 2 : mémoire distribuée

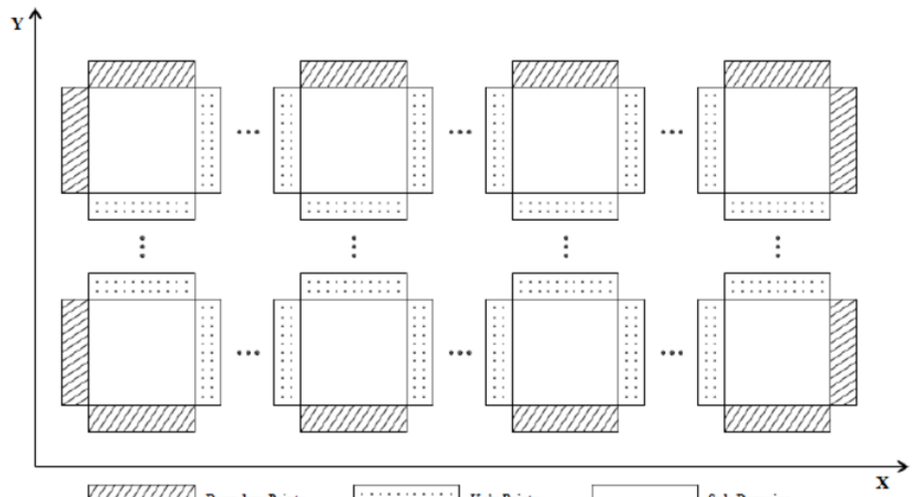




=> les coeurs de calcul n'ont pas accès
à une mémoire commune

=> échanges par message réseau

=> en pratique MPI gère aussi la mémoire partagée



Standard MPI
(Message Passing Interface)

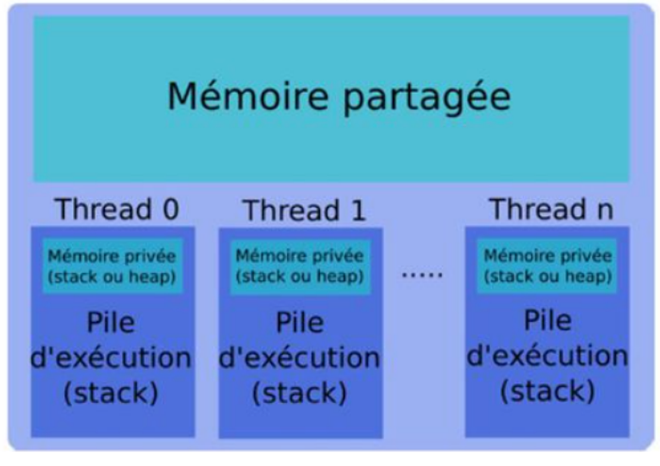
Implementation dans CROCO : OPENMP

- étape 1 : 2 fichiers à éditer
  - param.h
    spécifier la décomposition
    en x et y => NPP=4
  - cppdefs.h :
    activer OpenMP => *#define OPENMP*

```
!
! Domain subdivision parameters
! ====== =========== ==========
!
! NPP             Maximum allowed number of parallel threads;
! NSUB_X,NSUB_E   Number of SHARED memory subdomains in XI- and
!                                                  ETA-directions;
! NNODES         Total number of MPI processes (nodes);
! NP_XI,NP_ETA   Number of MPI subdomains in XI- and ETA-directions;
!
      integer NSUB_X, NSUB_E, NPP
#ifdef MPI
      integer NP_XI, NP_ETA, NNODES
      parameter (NP_XI=1,  NP_ETA=4,  NNODES=NP_XI*NP_ETA)
      parameter (NPP=1)
      parameter (NSUB_X=1, NSUB_E=1)
#elif defined OPENMP
      parameter (NPP=4)
# ifdef AUTOTILING
      common/distrib/NSUB_X, NSUB_E
# else
      parameter (NSUB_X=1, NSUB_E=NPP)
# endif
#else
      parameter (NPP=1)
```

- étape 2 : compiler
  ./jobcomp

- étape 3 : exécuter
  - export OMP_NUM_THREADS=4
    spécifie le nombre de cores à l'environnement
  - ./croco



Implementation dans CROCO : MPI

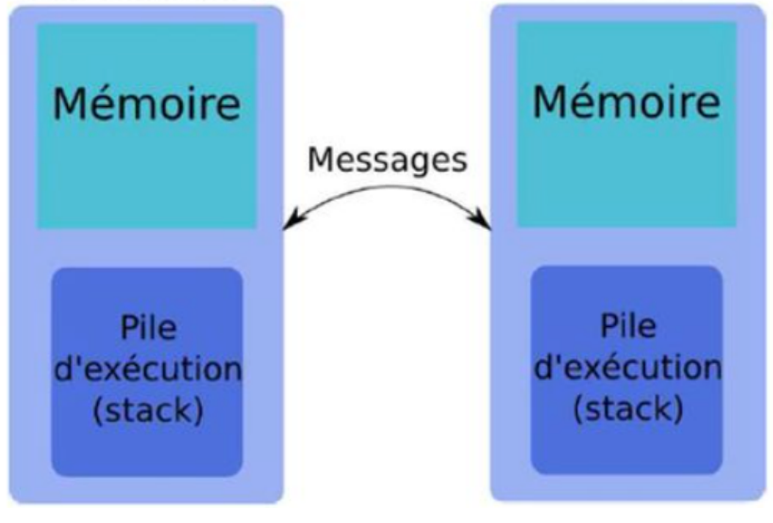
- étape 1 : fichiers à éditer
  - param.h
    spécifier la décomposition
    en x et y => NP_XI, NP_ETA
  - cppdefs.h :
    activer MPI => *#define MPI*

```
!
! Domain subdivision parameters
! ====== =========== ==========
!
! NPP             Maximum allowed number of parallel threads;
! NSUB_X,NSUB_E   Number of SHARED memory subdomains in XI- and
!                                                  ETA-directions;
! NNODES         Total number of MPI processes (nodes);
! NP_XI,NP_ETA   Number of MPI subdomains in XI- and ETA-directions;
!
      integer NSUB_X, NSUB_E, NPP
#ifdef MPI
      integer NP_XI, NP_ETA, NNODES
      parameter (NP_XI=1,  NP_ETA=4,  NNODES=NP_XI*NP_ETA)
      parameter (NPP=1)
      parameter (NSUB_X=1, NSUB_E=1)
#elif defined OPENMP
      parameter (NPP=4)
# ifdef AUTOTILING
      common/distrib/NSUB_X, NSUB_E
# else
      parameter (NSUB_X=1, NSUB_E=NPP)
# endif
#else
      parameter (NPP=1)
```

- étape 2 : compiler
  ./jobcomp

- étape 3 : exécuter
  - mpirun -n 4 ./croco

  (ou mpiexec ou autre)



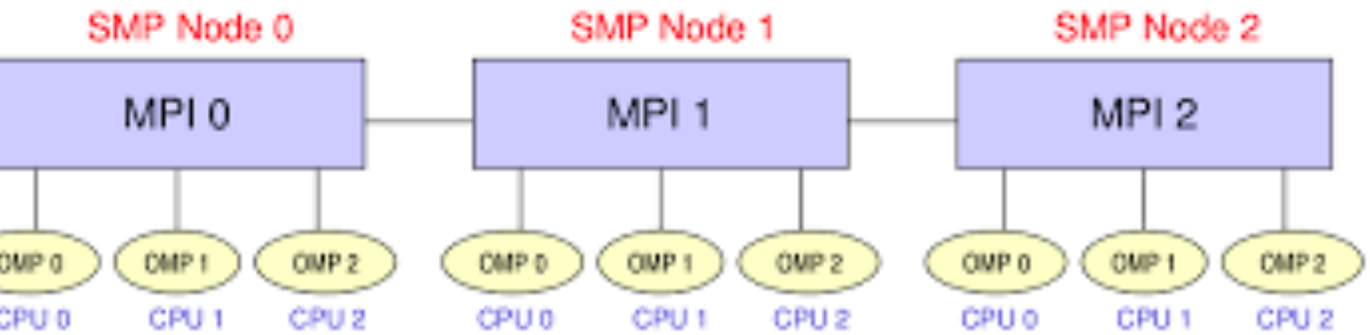
Résumé et perspectives

- 2 paradigmes disponibles MPI et OpenMP

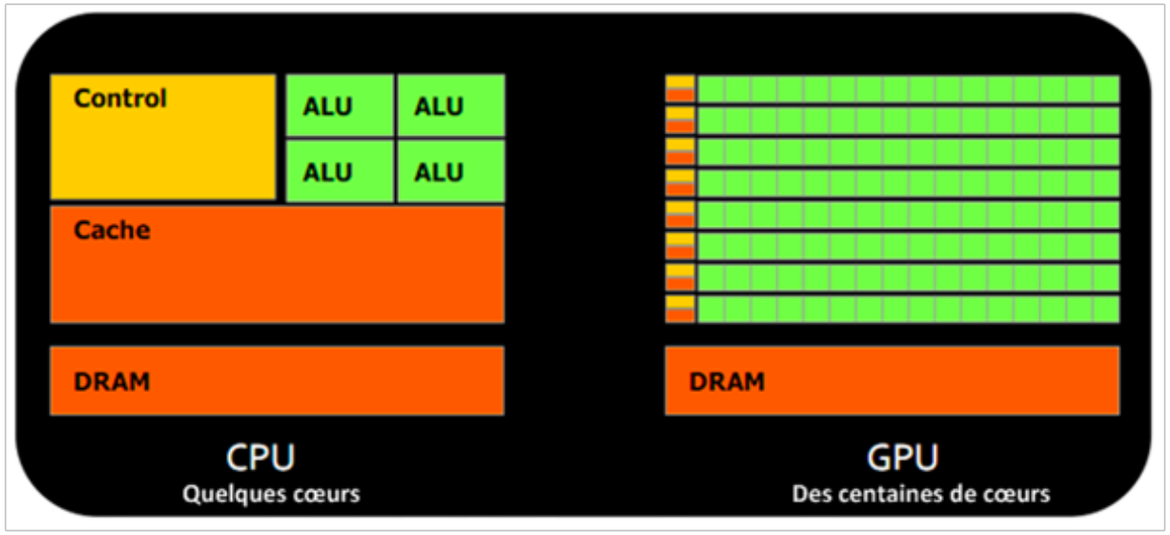
- code à recompiler !!

- MPI à privilégier (plus utilisé)

- Direction ETA à privilégier



pas de version hybride MPI/OpenMP



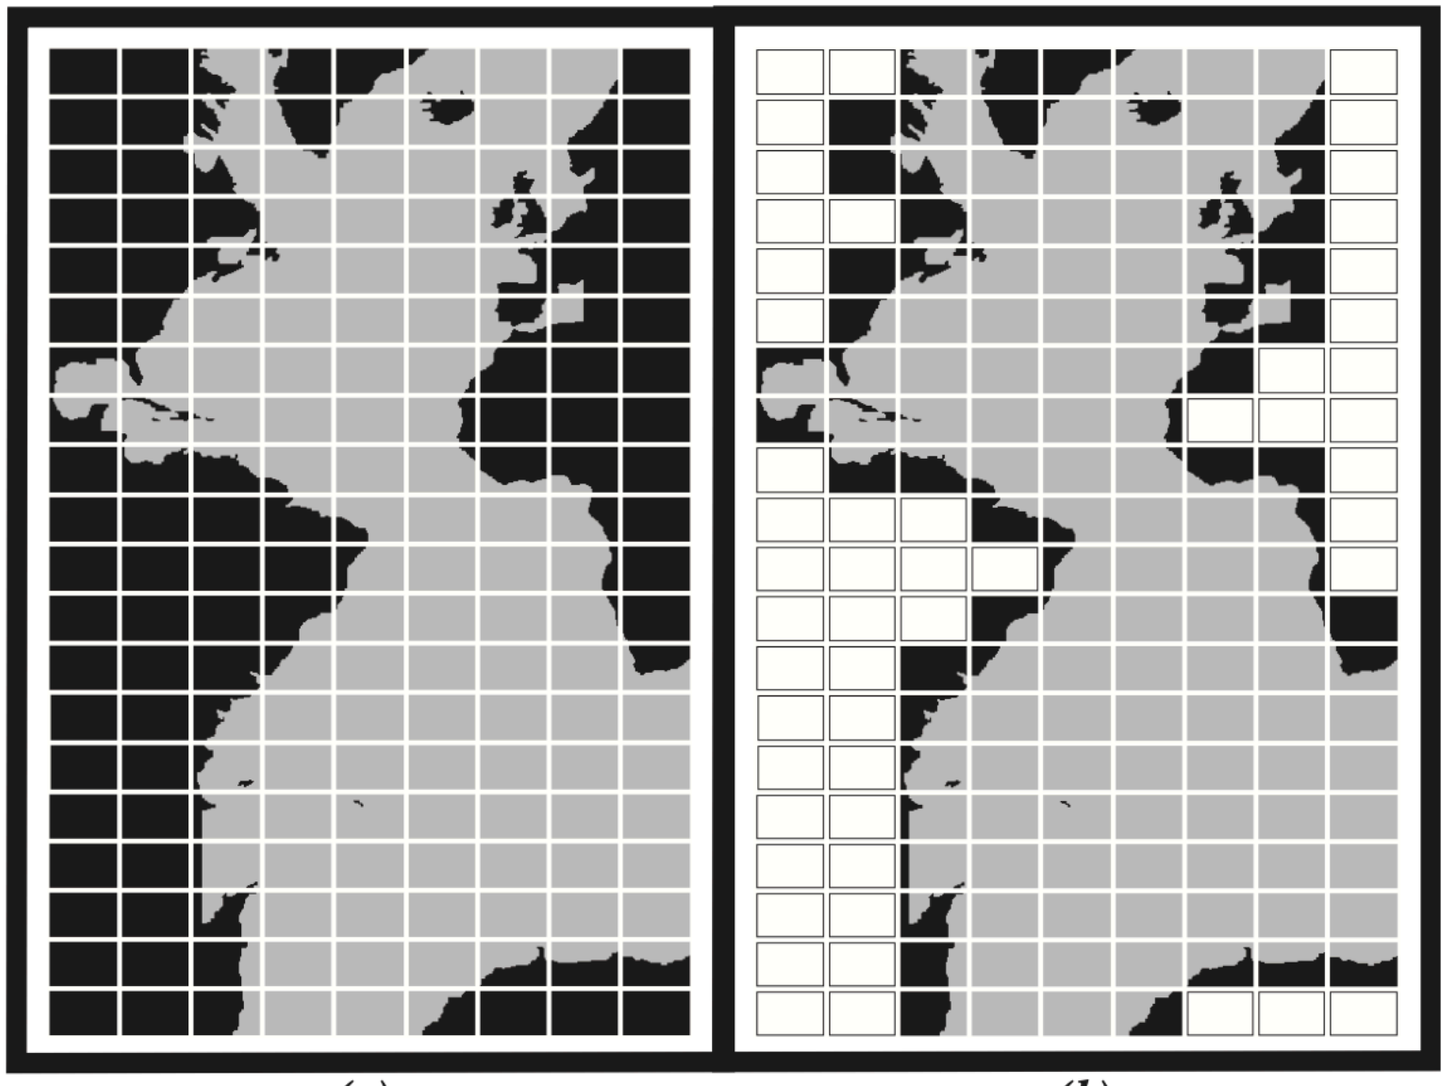
version GPU en développement

Parallelisation : mais aussi ….

Quelque subtilités :

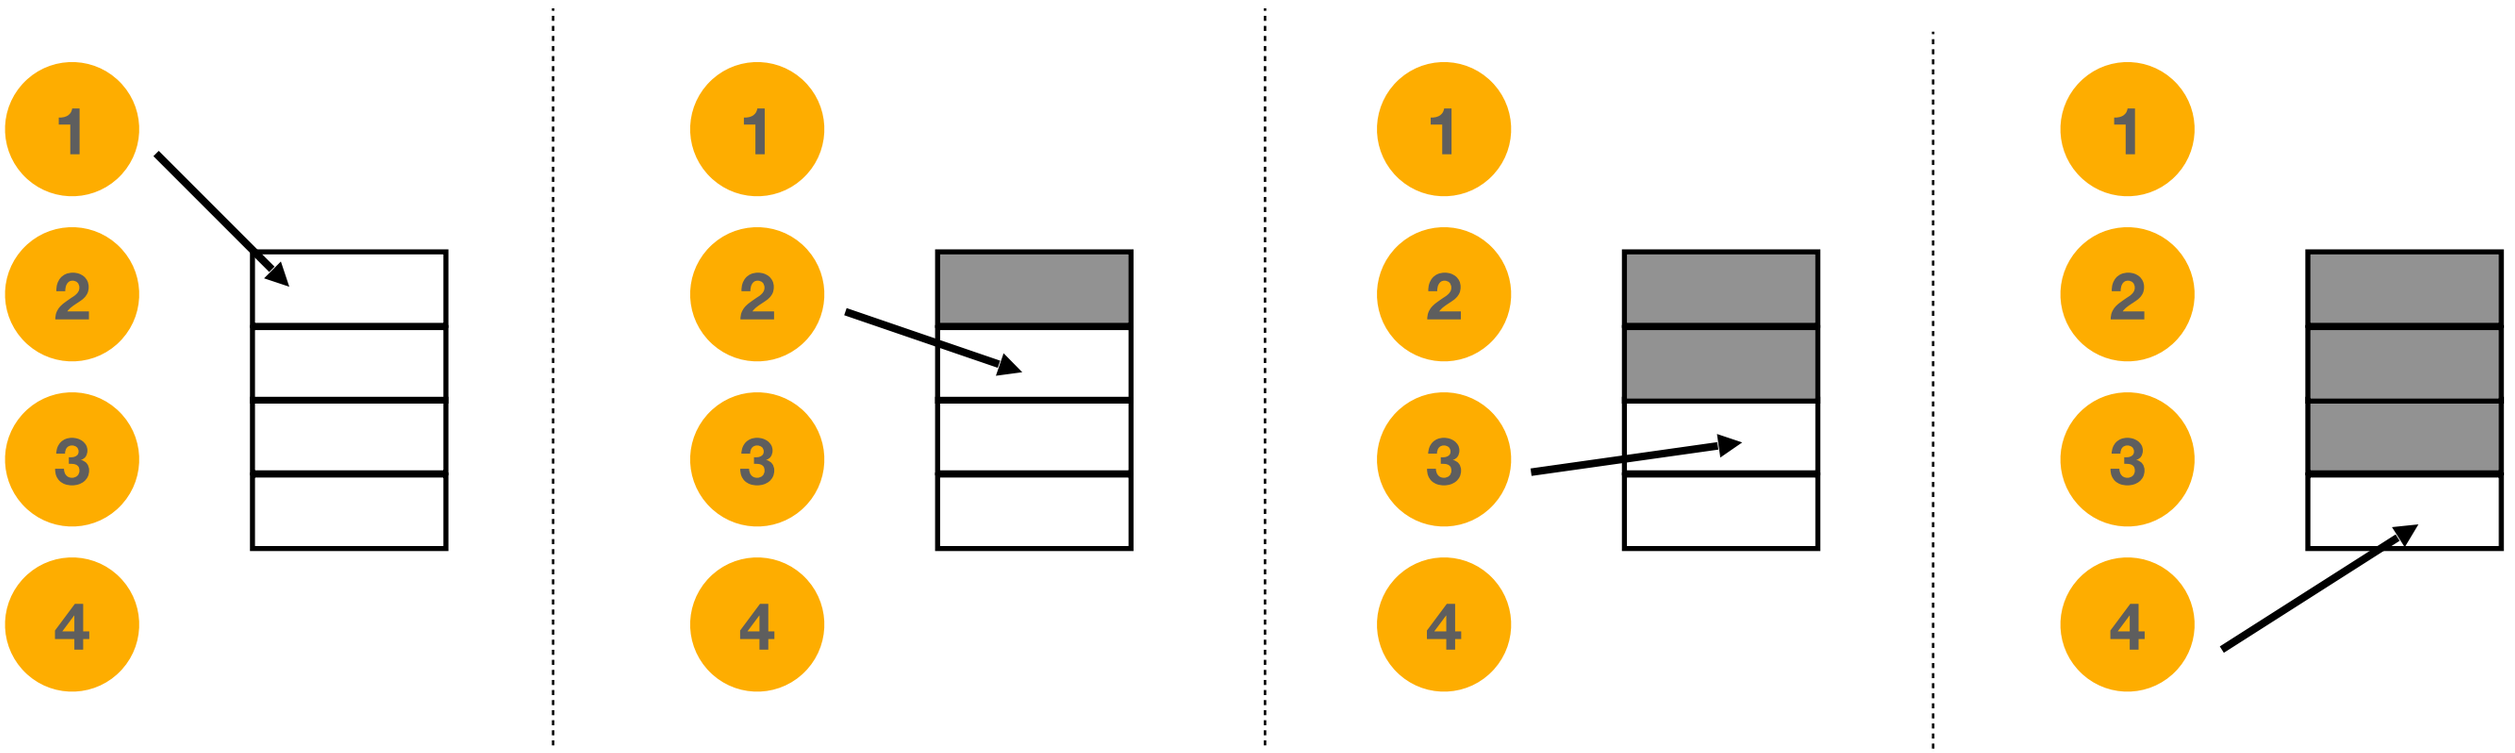
- le cas des fichiers de sortie (MPI)

- le cas des points terre



Ecriture de fichiers MPI 1/4 : par défaut

mpirun -np 4 ./croco. (NP_ETA=4)

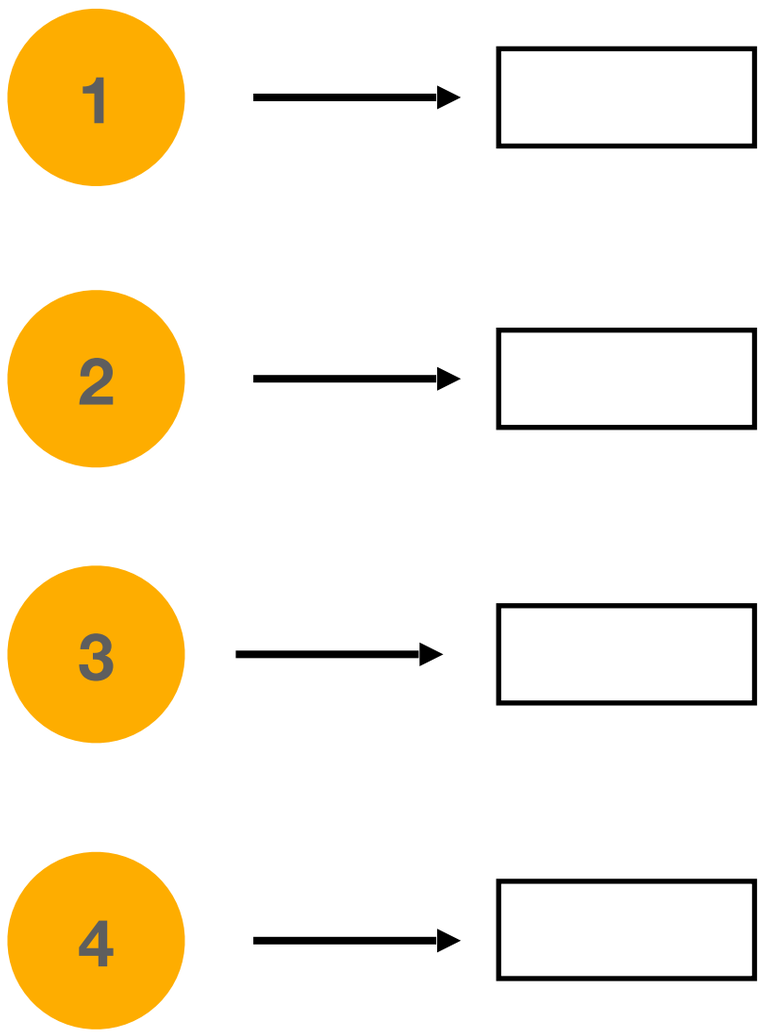


Très peu efficace !!!!!!!

Ecriture de fichiers MPI 2/4: fichiers parallèles

#define PARALLEL_FILES

mpirun -np 4 ./croco. (NP_ETA=4)



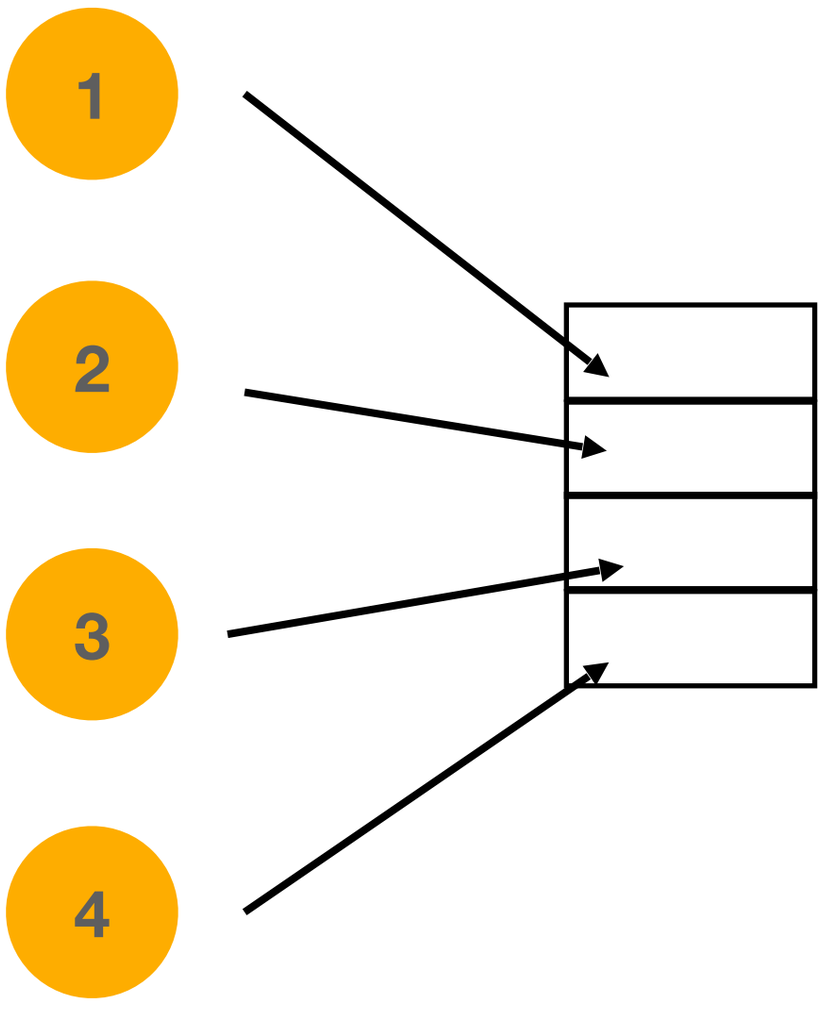
Rapide mais bcp de fichiers à l'arrivée.

Besoin de les recombiner (cf utilitaire ncjoin)

Ecriture de fichiers MPI 3/4 : écriture parallèle

#define KEY NC4PAR

mpirun -np 4 ./croco. (NP_ETA=4)

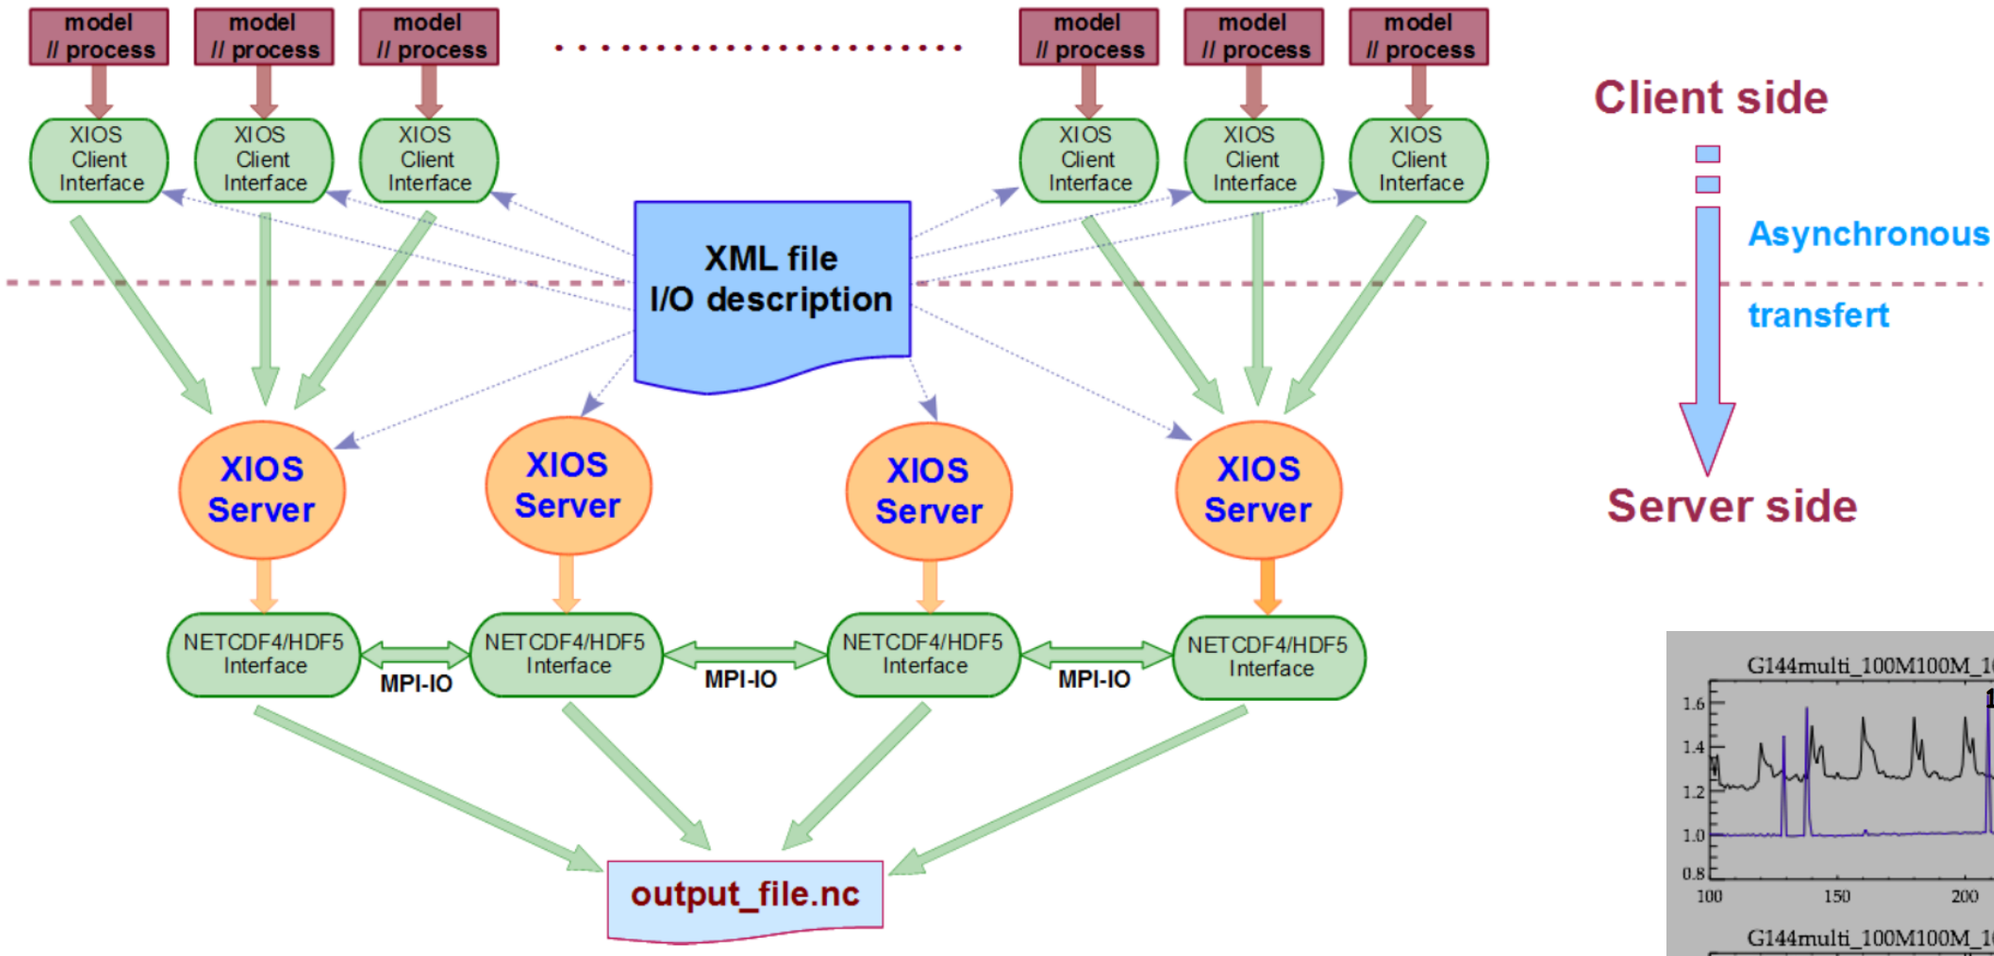


Rapide avec un unique fichier à l'arrivée !!!

Nécessite la librarie NetCDF4 installée avec support parallèle

Ecriture de fichiers MPI 4/4 : XIOS

XIOS



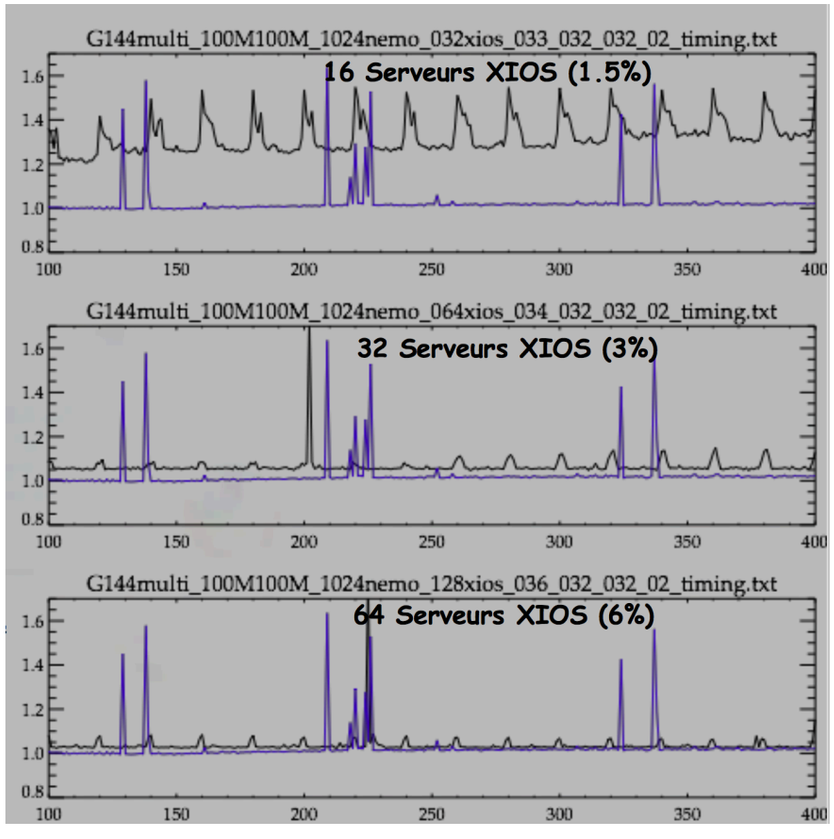
Strategy for outputs

XIOS : external server developed at IPSL

http://forge.ipsl.jussieu.fr/ioserver

Exemple

(S. Masson, from NEMO …)



Ecriture de fichiers MPI 4/4 : XIOS

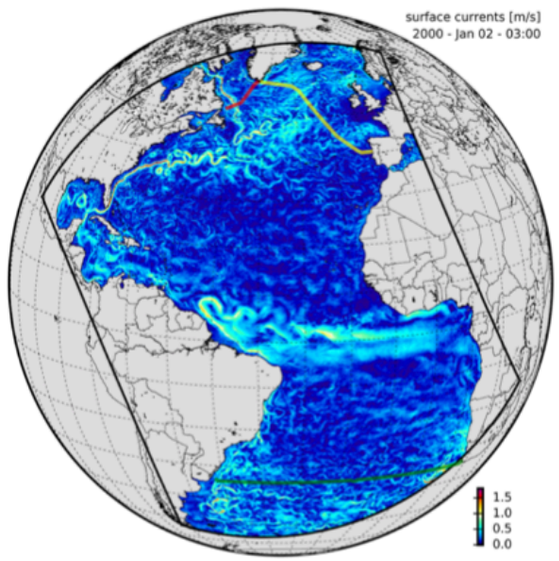
XIOS general

- Originally, a library dedicated to Input/Output management of large climate coupled models (e.g. CMIP simulations for IPCC with NEMO and other code)
- Written and managed at (LSCE-IPSL) by Y. Meurdesoif et al.
- XIOS creates output NetCDF files
- Implemented in other codes (ROMS, MARS3D, CROCO) by non-xios-expert developers despite of a light existing documentation.
- All documentation at http://forge.ipsl.jussieu.fr/ioserver with tutorials, user guide
- Installation of XIOS could be not an easy task to do on a new machine, be sure
  it is already well installed with the right netcdf4 library !
- In the next croco version, XIOS version >=2

Ecriture de fichiers MPI 4/4 : XIOS

XIOS why and when ?

- I/O becomes a bottleneck in parallel computing with using a large amount of processors
  e.g. Atlantic model at **1km** resolution :
  10000 x 14000 x 200 grid points ; using up to ~50000 procs



3km resolution

=> Very difficult or impossible to manage such amount of output datas with classical netcdf library.

- Only an external configuration file is needed to configure the outputs (no need to compile each time)

- create new files
- create new variables from referenced variables
- use time filter (instantaneous, average, cumulate, ...)

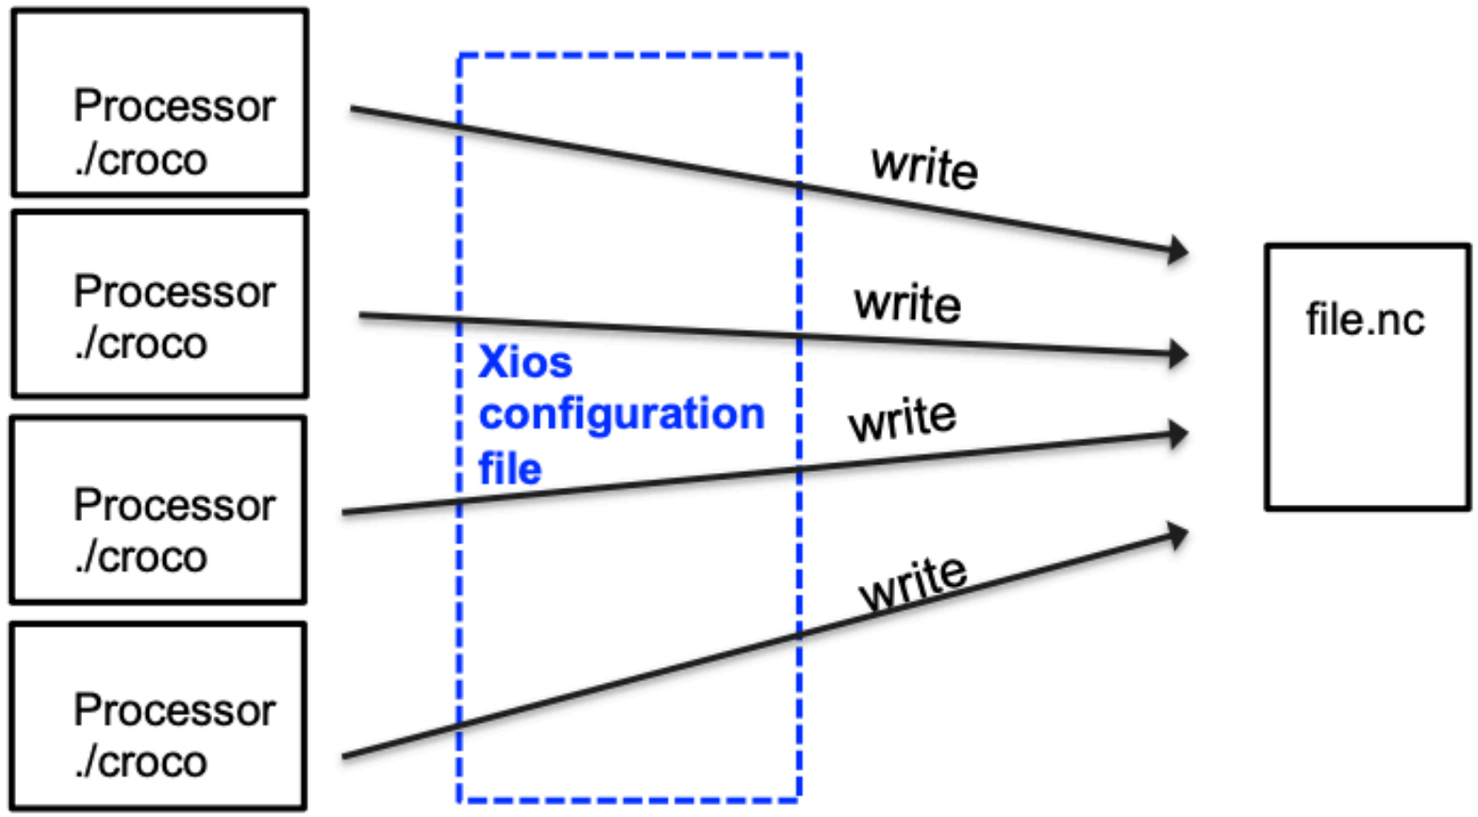
1. Efficiency in production of data on supercomputer parallel file system
2. Flexibility and “simplicity” in management of I/O and data definition

Remark : It is may be not so “ simple ” for beginners because you need to understand how to modify the configuration file written in xml

Ecriture de fichiers MPI 4/4 : XIOS

XIOS : attached mode

Using xios in **attached mode** :
each croco executable **compute** and **write** (like a classical library)

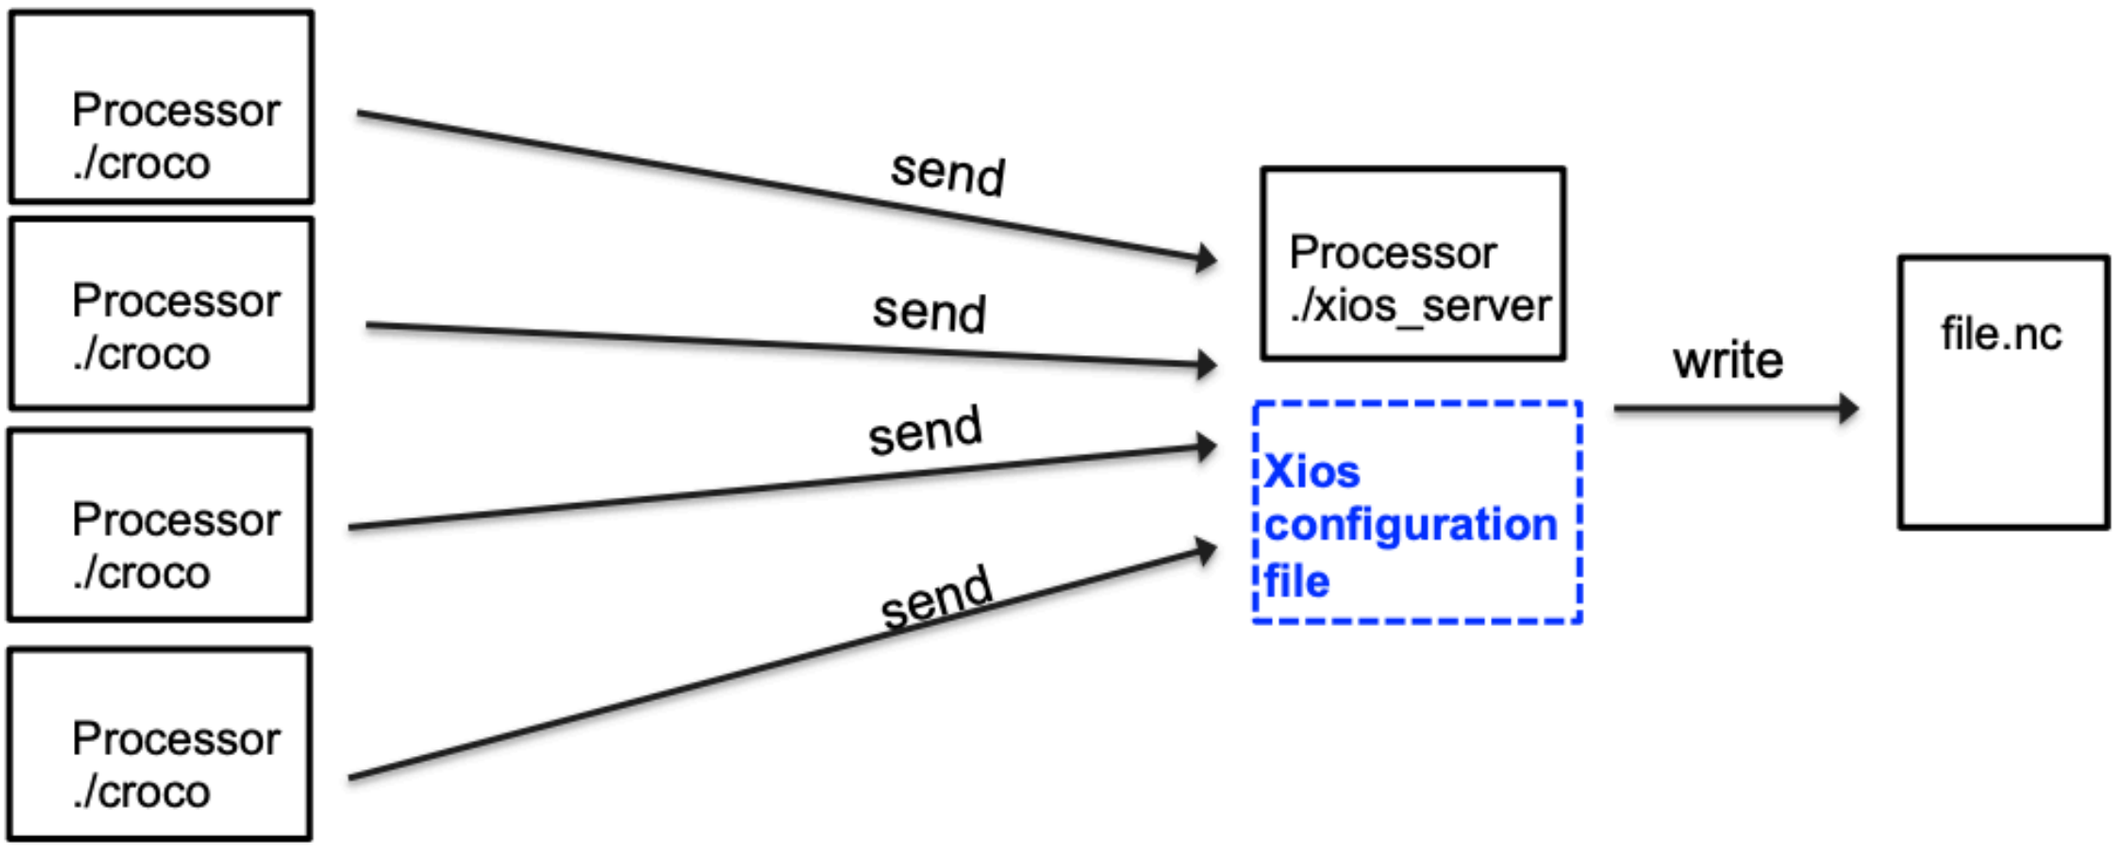


Ergonomy AND efficient parallel writing BUT writing overhead

Ecriture de fichiers MPI 4/4 : XIOS

XIOS : detached mode (server mode)

each croco executable compute and send field to the server



- croco executables for computing only
- only xios server writes output
- Flexibility AND efficient parallel writing AND (almost) no overhead

Ecriture de fichiers MPI 4/4 : XIOS

XIOS : in practice

- In cppdefs.h add ccp keys : #define XIOS
- Add the XIOS library path in jobcomp
- Compile once : ./jobcomp
- Edit/modify xios configuration file : iodef.xml
- To run :
    - in attached mode : as usual
    - in detached mode : like a coupled model …

    mpirun -np 10 ./croco -np 2 ./xios.exe

Le cas des points terre

1. Préprocessing

Dans croco/MPI_NOLAND :
- lire le README
- compiler: edit makefile + make
- editer la namelist :
  - nom du fichier grille
  - nombre de procs max
- exécuter : ./mpp_optimize
- visualiser :
./mpp_plot.py croco_grd.nc benguela-008x005_033
- re-lire le README …

2. Avant de compiler CROCO

- cppdefs.h : #define MPI_NOLAND
- param.h : insérer les valeurs pour NP_XI, NP_ETA and NPP données par le preprocessing
(NPP <= NP_XI x NP_ETA)
- exécution habituelle (mpirun -np *etc*)

WARNING : grid file as to be called croco_grd.nc (or to be changed in MPI_Setup.F)
